Build and learn models with sklearn In this article, we will build a text classification model to understand a movie review dataset. In this article, we will build a text classification model to understand a movie review dataset. This is the latest version of an old article. All of the notebook examples are available at [ this Kaggle notebook]( To learn more about the notebook, please see [ the blog post about the notebook]( # 1. Install the Kaggle notebooks The notebook is built on [Kaggle notebooks]( Install these [dependencies]( and [make sure you have the latest version]( Run the following command to install all dependencies ""sh cd text\_classification\_with\_keras\_spacy bash./resources/dependencies.sh "" This installs Kaggle notebooks. Now, you need to 'cd' to the text\_classification\_with\_keras\_spacy directory. # 2. Import Data We are going to use the Movie Reviews Dataset from [Kaggle]( to build a text classification model. ""bash python -m spacy download en\_core\_web\_sm python -m spacy download en\_core\_web\_md export SPACY\_PATH=pwd/en\_core\_web\_sm export SPACY\_PATH=pwd/en\_core\_web\_md python train.py # 3. Clean Up This notebook uses a "Lets do it!" approach for cleaning up. If you have f3e1b3768c
