Billa 2 Full Movie Hd 1080p Blu-ray Tamil 54 .. * $\gamma\gamma$ collisions provide a clean environment, free of jets, where the measurement of the photon-induced bremsstrahlung can be made. These reactions have the advantage that the photon conversion is unprimed, and the K_L or K^0_L can be detected as opposed to the positron, electron or muon from the jet. The resulting radiation will be inside the central detectors, which are more efficient, and will have the additional advantage that the bremsstrahlung photons, generated at a known angle, are more easily reconstructed. The rapidity distribution of the bremsstrahlung photons should be sensitive to the gluon distribution, but is also sensitive to the quark distributions. * $\gamma\gamma$ collisions, although less clean than $\{e^+e^-\}$ collisions, have the advantage that, because of the absence of jet activity, the experimental signature of bremsstrahlung can be easily separated from jet activity. This separation is achieved because the bremsstrahlung photons are produced only in the central region of the collision and the jet activity is peaked in the forward region. The photon spectrum is more clean because the forward jet activity is not present. The other advantage of $\gamma\gamma$ is that the K_L will not suffer from the issue of b fragmentation.
